

Propguru CRM – MySQL Schema Research

Property Inventory & Valuation Data Points

Database: fde_dev (MySQL 8.4) **Scope:** Understanding what data is captured per property unit and what signals are available for AI-based valuation **Status:** Research / Pre-build analysis

1. The Core Mental Model

Every property deal is one row in the `inventories` table. That single row is the **unit of evaluation**. Everything else — society, locality, visits, offers, features — links back to it via foreign keys.

2. What Describes a Unit – Input Signals by Category

2.1 Physical Unit Attributes

The most consistently populated fields. Present on 95%+ of units.

Data Point	Table / Field	Population	Values
BHK type	inventories.bhk_id → inventory_bhk_types	~100%	1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5 BHK
Carpet area (sqft)	inventories.unit_size_id → inventory_society_unit_sizes.size	89% (609/684)	Varies by society
Floor number	inventories.floor_number	99% (677/684)	Integer
Total floors	inventories.total_floor	60% (412/684)	Integer
Furnishing status	inventories.furnished_status_id → inventory_furnishing_types	96% (654/684)	Unfurnished / Basic Semi-Furnished / Semi-Furnished / Good Semi-Furnished / Fully-Furnished
Balcony facing	inventories.balcony_facing_id → inventory_facing_types	65% (446/684)	North / South / East / West / North-East / North-West / South-East / South-West
Exit facing	inventories.exit_facing_id → inventory_facing_types	Lower than balcony	Same 8 directions
Covered parking	inventories.covered_parking	23% non-zero (160/684)	Integer count
Open parking	inventories.open_parking	Similar	Integer count
Registry status	inventories.registry_status_id → inventory_registry_status_types	98% (670/684)	Registered / Unregistered
Occupancy status	inventories.occupancy_status_id →	44% (299/684)	Owner Occupied / Tenant Occupied /

Data Point	Table / Field	Population	Values
	inventory_occupancy_status_types		Vacant
Tower	inventories.society_tower_id → inventory_society_towers	76% (523/684)	Tower name within society
POC type	inventories.poc_type_id → inventory_poc_types	61% (420/684)	Channel Partner / Customer

Many-to-many unit attributes — low coverage but high quality when present:

Attribute Category	Junction Table	Lookup Table	Units Covered	Values
Interior features	inventory_feature_map	inventory_feature_types	33 units	Modular Kitchen, False Ceiling, Wood Flooring, Spacious Unit, No Seepage, New Interiors
Views	inventory_view_map	inventory_view_types	147 units	Society / Garden / Park / Pool / Road / Lake / Open View
Extra rooms	inventory_extra_room_map	inventory_extra_room_types	29 units	Puja Room / Study Room / Store Room
Condition observations	inventory_observation_map	inventory_observation_types	16 units	Minor/Extensive Seepage, Damaged Flooring, Damaged Walls, Needs Painting, Needs Repairs, Old/New Interiors

2.2 Price Data on the Unit

This is where evaluation lives. Multiple price fields exist on the `inventories` row — each with a different meaning and reliability.

Field	Meaning	Population	Notes
customer_asking_price	What the seller is asking	~100%	Always the first known data point. Starting anchor for negotiation.
initial_customer_asking_price	Snapshot of original ask before negotiations	~100%	Difference vs. customer_asking_price shows negotiation movement
competition_pickup_price	Price a competing buyer offered	11% (73/684)	Strong signal — reveals real demand from other market participants
proho_tool_valuation	Propguru's internal pricing tool output (hand-entered by RM)	47% (324/684)	Human benchmark — the most consistently available valuation reference
acre_99_listing_range	Price range from 99Acres, stored as free text	50% (342/684)	Format: "75-82L", "90-1.05CR" — needs parsing to numeric
housing_listing_range	Price range from Housing.com, stored as free text	3% (21/684)	Same format, very sparse
registry_maxima	Maximum declared value in last registry transaction	11% (72/684)	Last known government-registered transaction value
last_registry_month	Month of last registry	10% (70/684)	e.g., "January", "February"
last_registry_year	Year of last registry	10%	Integer year
sourcing_price	What Propguru actually paid — ground truth acquisition price	3% (22/684)	Most valuable label — grows with deal volume
sourcing_brokerage	Brokerage paid to sourcing CP	On sourced deals	Additional cost on top of sourcing_price
cost_to_company	Total cost including all expenses	Populated, often 0	

Field	Meaning	Population	Notes
listing_price_to_sell	Price Propguru lists the unit at for resale	Low	Propguru's asking price on exit side
selling_price	Final sale price	1% (9/684)	Ground truth exit label — very sparse today
selling_brokerage	Brokerage paid to selling CP	Low	

2.3 Geographic and Society Context

Data Point	Source	What It Tells You
Micro market	micro_markets.name	Biggest price differentiator — Gaur City vs. Greater Noida West vs. Central Noida each have distinct price bands
Locality	localities.name	Sub-area (e.g., Sector 16C Greater Noida West)
Society name	inventory_societies.name	Housing complex — strongest comparable anchor
Builder	inventory_societies.builder	Brand quality (Gaur, Mahagun, Eros, Supertech, Paramount, etc.)
Society age	inventory_societies.age	Building age — sparse (NULL on most societies currently)
99Acres listing URL	inventory_societies.acres_99_listing_url	Direct market listing link per society

The geo chain is well-populated and clean. It is the primary grouping for comparable analysis.

2.4 Deal Activity Signals

These reveal how the market is responding to a specific unit.

Signal	Table	Coverage	What It Tells You
Visit count	inventory_customer_visits	886 visits across 26 units	Demand intensity — high visits = market interest
Visit type	visit_type field	First Visit (838) / Revisit (35)	Revisits signal stronger buyer intent
Visit status	visit_status field	Completed (873) / Upcoming / Cancelled	
CP on visit	inventory_visit_cp_map	791 rows	Which CPs are bringing buyers to this unit
Offer — company	inventory_offer_negotiations (offer_from='Company')	121 rows	What Propguru is willing to pay
Offer — customer/CP	inventory_offer_negotiations (offer_from='Customer')	91 rows	What seller/CP counter-offers
Accepted offers	offer_status = 'Accepted'	6 rows	Final agreed price — negotiation ground truth
Sanctioned amount	inventory_offer_negotiations.sanctioned_amount	Sparse	Bank sanction on the unit
Deal notes	inventory_deal_notes	4 rows	Freetext RM observations — qualitative

2.5 Sourcing Score (Pre-Existing)

`inventories.sourcing_score` is a pre-computed integer score on 68 units. Values observed: 68, 72, 76, 80, 84. The scoring logic is not in the database — it is applied externally before unit entry. It appears to represent lead quality. Most high-scoring units (84) have garbled price data suggesting they are test records. For real sourced deals this field is mostly absent, so it cannot be relied on as an input today.

3. The Deal Lifecycle – Where Evaluation Fits

The `inventory_status_types` table defines two sequential pipelines with 24 statuses total.

Sourcing Pipeline (buying from seller)

```
Submitted (220 units reached)
  ↓
Owner Onboarding (35 units)
  ↓
Evaluation (53 units) ← AI EVALUATION OPPORTUNITY
  ↓
Negotiations Ongoing (81 units) ← offer_negotiations rows created here
  ↓
Token Initiated (4)
  ↓
TA Executed (30) → Documents Received (9) → DD Passed (9) → AMA Executed
(27) → Key Received (21)
  ↓
[sourcing_price set on inventories row]
```

Terminal statuses: Lost (13 units), Rejected (52 units), Waitlist (9), Awaiting Details (5)

Selling Pipeline (after acquisition)

```
Refurbishment in Progress
  ↓
Ready for Visits ← inventory_customer_visits created here
  ↓
Buyer Token Received (13)
  ↓
ATS Executed (9) → Bank NOC Applied → Builder NOC Applied → TM Applied →
Registry Done (8)
  ↓
[selling_price set on inventories row]
```

Funnel reality: 220 submitted → 53 reached Evaluation → 27 AMA executed → 9 final Registry Done. Roughly 25% of submitted leads convert to acquisition; ~4% complete the full buy-refurbish-sell cycle.

Every status transition is logged in `inventory_status_history` with timestamp, `changed_by`, and remarks (707 rows total).

4. Reliable vs. Sparse – Practical Data Availability

Tier 1 – Always Available (build valuation on these)

Signal	Field	Reliability
BHK type	bhk_id → bhk name	✅ ~100%
Carpet sqft	unit_size_id → size	✅ 89%
Floor number	floor_number	✅ 99%
Furnishing	furnished_status_id	✅ 96%
Registry status	registry_status_id	✅ 98%
Society	society_name_id	✅ 100%
Locality + Micro market	via society	✅ 100%
Seller asking price	customer_asking_price	✅ ~100%

Tier 2 – Available on ~Half the Units (use as supporting signals)

Signal	Field	Reliability
Balcony facing	balcony_facing_id	⚠️ 65%
Tower	society_tower_id	⚠️ 76%
Occupancy status	occupancy_status_id	⚠️ 44%
Propguru internal valuation	proho_tool_valuation	⚠️ 47%
99Acres listing range	acre_99_listing_range	⚠️ 50% (text, needs parsing)
Competitor offer price	competition_pickup_price	⚠️ 11% (high signal when present)
Registry transaction data	registry_maxima + month/year	⚠️ 10%

Tier 3 – Sparse Today, Critical as Volume Grows (ground truth labels)

Signal	Field	Current Coverage	Role
Sourcing price (buy)	sourcing_price	3% (22 units)	Training label: what Propguru paid
Selling price (exit)	selling_price	1% (9 units)	Training label: what Propguru sold for
Accepted offer price	offer_negotiations where offer_status='Accepted'	6 units	Negotiation ground truth
Views, features, observations	many-to-many maps	16–147 units	Condition/quality signals

5. Societies with Most Data – Best Starting Point

Top societies by unit volume with price data:

Society	Micro Market	Units	Avg Asking Price	Sourced Units	Sold Units
Gaur 14th Avenue	Gaur City	70	₹1.04 Cr	1	1
Gaur 11th Avenue	Gaur City	34	—	0	0
Panchsheel Greens II	Greater Noida West	29	₹84L	2	2
Eros Sampooranam	Greater Noida West	24	₹91L	2	1
Mahagun Mywoods Phase 1	Gaur City	23	₹1.53 Cr	0	0
Galaxy Vega	Greater Noida West	—	—	1	1
Wall Rock Aishwaryam	Greater Noida West	13	₹87L	2	2
Galaxy Royale	Gaur City	12	₹77L	1	1
Nirala Aspire	Greater Noida West	17	₹1.01 Cr	1	0

6. The Key Data Gap

There is **no standalone market transactions table** in MySQL. The closest signals are `registry_maxima`, `last_registry_month`, and `last_registry_year` — all hand-entered by RMs on the `inventories` row. The system has no systematic feed of comparable sales from 99Acres, Housing.com, or the government registry.

This means the AI evaluation will need to:

1. Use `proho_tool_valuation + acre_99_listing_range` as the primary external market anchors (available on ~50% of units)
2. Use internal comparables — `sourcing_price` of similar units in the same society — as the transaction anchor (requires cross-unit querying within the same `society_name_id`)
3. Use `offer_negotiations` history as a negotiation signal (price trajectory from ask to accepted)

Closing this gap by adding a `market_transactions` table per society (or ingesting from an external API) would be the highest-leverage schema addition before building AI valuation.

7. Recommended Evaluation Data Model for AI

Based on all of the above, here is the minimal data extraction needed per unit to evaluate it:

Unit Context

- └─ `inventory_id`, `inventory_name`, `flat_number`
- └─ `bhk` (name), `sqft` (size), `floor_number`, `total_floor`
- └─ `furnishing` (name), `facing` (name), `parking` (covered + open)
- └─ `registry_status` (name), `occupancy_status` (name)
- └─ `society` (name, builder, age, `99acres_url`)
- └─ `locality` (name), `micro_market` (name), `city` (name)
- └─ `tower` (name)

Price Signals

- └─ `customer_asking_price` ← always available
- └─ `proho_tool_valuation` ← 47% – internal benchmark
- └─ `acre_99_listing_range` ← 50% – external market range (parse text)
- └─ `competition_pickup_price` ← 11% – competitor signal
- └─ `registry_maxima` + month/year ← 10% – last transaction anchor
- └─ `sourcing_price` of comparable units in same society ← cross-unit query

Deal Context

- └─ current status in sourcing pipeline
- └─ `offer_negotiations`: all offers, directions, accepted price if any
- └─ visit count and revisit count
- └─ `deal_notes` (freetext)

Qualitative Signals (when present)

- └─ `views` (society / garden / park / pool / open)
- └─ `features` (modular kitchen / false ceiling / new interiors)
- └─ `observations` (seepage / damaged flooring / needs painting)
- └─ `extra_rooms` (puja / study / store)

This is the complete input surface available from the current MySQL schema for AI-based property valuation.
